# PeterPortfolio

## UI and UX Design Document

**My name is Shyaka Peter Guy.**

**Student:** Shyaka Peter Guy

**Registration number:** 24/26559

**Verification code:** MOB-A2-6559

**Application version:** 1.0.0

### Concept and purpose

PeterPortfolio is a small Android portfolio intended to introduce a software engineering student to internship reviewers. It brings together a concise introduction, technical skills, education, project examples and an editable profile in one mobile app.

### Intended audience

An internship recruiter, innovation challenge reviewer or academic assessor who needs to understand the student’s profile and project experience quickly.

### Visual direction

A calm blue-and-white interface, readable hierarchy, consistent cards, clear action labels and a simple bottom-tab structure. Content should be truthful and personalized before final submission.

# 2. User flow and information architecture

### Main navigation

- Home — introduction, avatar/profile image, headline, biography, skill/status tags and verification code.
- Skills — at least five skills and an education/training timeline.
- Projects — at least two genuine projects, each opening a detail screen.
- Profile — edit headline, biography, primary skill and availability; validate and save.
- About — app name, student identity, registration number, verification code, version and data-use statement.

### Navigation and state flow

Bottom tabs host the main sections. Selecting a project pushes a Project Details screen onto a nested native stack. Android Back should return to the Projects tab without losing the current session.

### Profile persistence flow

Edit fields → validate all required rules → show field-level messages if invalid → otherwise save the profile to AsyncStorage → restore saved data when the app is reopened.

### Profile media flow

Ask for gallery/camera permission → allow image selection or capture → preview image → let the user replace or remove it. If permission is denied or selection is cancelled, show a clear message and keep the rest of the portfolio usable.

### Offline flow

Core screens and saved local profile information should remain usable in Airplane Mode. Any optional external link should be labelled as requiring a connection.

# 3. Wireframes — Home and portfolio content

### Home screen wireframe

**PeterPortfolio**
[Profile avatar / selected image]

**My name is Shyaka Peter Guy.**
Software Engineering Student

Short biography and primary skill
Availability status
**MOB-A2-6559**

[Choose image] [Take photo] [Remove image]

### Skills and education wireframe

**Skills & Education**
1. Python
2. JavaScript
3. TypeScript
4. React Native
5. HTML and CSS

**Education / Training timeline**
Current programme and verified dates
Mobile development training

Annotations: use reusable skill cards; show education details only when accurate; keep text scrollable on narrow phones.

# 4. Wireframes — Projects, editor and About

### Projects and project detail

**Projects**
[Project card 1: title, problem, technology, View details]

[Project card 2: title, problem, technology, View details]

**Project Details**
Project title
Problem
My contribution
Technology used
Outcome / evidence
[Back to portfolio]

### Profile editor

Headline: [text field]
Biography: [multiline field]
Primary skill: [text field]
Available for opportunities: [switch]
[Save profile] [Reset profile]

**Validation state**
Headline must contain at least 5 characters.
Biography must contain at least 30 characters.
Primary skill must contain at least 2 characters.
Invalid values must not be saved.

About screen must display PeterPortfolio, Shyaka Peter Guy, 24/26559, MOB-A2-6559, version 1.0.0 and a brief statement that low-risk profile data is stored locally on the device.

# 5. Visual, accessibility and privacy decisions

## Visual system

Primary blue #275DAD; pale blue #EEF4FF; dark text #172033; secondary text #596579; white cards #FFFFFF; background #F6F8FC; borders #DCE3EE. Use consistent heading styles, spacing and card treatments. Avoid fixed-width layouts so screens remain usable on narrow phones.

## Accessibility

- Give every input and important control a meaningful accessibility label.
- Use field-level text messages for errors; do not communicate errors through color alone.
- Use comfortable font sizes, readable contrast and touch targets of approximately 44 points.
- Test scrolling and Android increased-text-size settings.
- Keep navigation labels understandable and ensure Android Back returns to the previous screen.

## Privacy and offline behavior

Store only low-risk portfolio fields and a profile-image URI locally with AsyncStorage. Do not store passwords, tokens or sensitive records. The core portfolio should not depend on a network connection. Test image restoration on the target Android device because image URI access can vary.

## Implementation comparison and evidence

After running the app, replace the wireframe placeholders with screenshots from the actual application if desired. Only report type-check, device, Airplane Mode, APK and persistence tests after performing them. The wireframes are design artifacts, not proof that the final build has been tested.
